

Next Generation Identity Verification

Leave cumbersome, time-consuming, and weak verification processes behind with an innovative authentication and digital identity service -- Synerio Secure™.

Leveraging AI, biometric and encryption technologies, Synerio Secure creates a unique digital identity that utilizes advanced facial liveness detection to verify that the individual is a real person.

Synerio Secure enables organizations to:

- Verify an individual's identity remotely
- Enable secure access to your systems—without passwords

One-time onboarding is quick and easy

Individuals create their own digital identity in a one-time onboarding process by uploading a government-issued form of ID (driver's license, passport, etc.) via their smartphone's camera or NFC technology, along with a comparison selfie.

For your users, it only takes a matter of seconds to set up their Synerio Secure digital identity on their smartphones, and then just a few minutes to verify their identity to you without the need for emailed photos, one-time codes, video meetings or two-factor authentication.

Maintaining respect for the privacy of the end user

Our solution protects business and government as well as the individuals who work for them or access their systems. We protect your organization against cyber threats while offering unprecedented ease of use and access. Our unique user-centric approach enables organizations to confirm a individual's identity without the exchange of private data. The user onboards once and creates a digital identity which they can use across multiple organizations. They are in control of their digital identity and Synerio will only use and/or share identity information with the individual's permission.

KEY FEATURES

Efficient

Streamline identity verification and eliminate the need for manual processes.

Fast and easy to use

Individuals can onboard in just a few minutes utilizing their smartphone technology.

User-centric identity management

The digital identity stays with the individual and their private data is not stored or uploaded to the cloud.

Remote Verification

Identity can be verified remotely.

Secure

Protect against cyber threats and unauthorized access using the most secure processes available.

Innovative, global solution

Our AI algorithms have passed bias testing across all races and genders, supporting 140 languages, 250+ countries/territories, and 10,500+ different ID document templates.

Compliant by nature

Automatically complies with privacy regulations, data management standards and zero trust architecture models.

Behavioral and conditional options

Enables you to use additional layers of security based on location, IP address, time of day, etc.

Beyond identity verification

Full suite of verification, authorization, analytics, and data management services

Synerio offers business and government end-to-end identity verification, permissioned-based access, analytics, and data management solutions that connect individuals to the infrastructure, assets, and data they need quickly and seamlessly.

Once the individual's identity has been confirmed, our solution can grant highly flexible and user-specific permissions to ensure that the right person is accessing the right information at the right time for the right reason. Synerio only permits access to the specific data or programmatic functions that the individual has been authorized to access. Tokens enable precise access control based on identity, IP address, device, geolocation, time, completed training, licensure, credentials, age, or other attributes.

From healthcare to e-government to financial services, our solution can protect and secure for multiple use cases. Let us tailor a solution that meets your unique needs.
